

Labhouse

Live streaming services from set, reminder for shoots in times of global distancing.

Since a few years back we have been working on streaming live camera feeds from film shoots in Uruguay to different continents around the world. Today we can offer doing so with four cameras simultaneously, such as **Alexa, RED, Sony** etc.

Through streaming directly to Teradeks professional cloud encoder and routing platform (**Core**) we can distribute the feeds through different channels for the team, which can be based on different locations.

On the receiver side we offer either Teradeks CoreTV proprietary app, and also private setup channels with password through platforms such as IBM video, Livestream (Vimeo), etc.

Feeds can be recorded for later viewing, as well as recorded on mobile devices or laptops. The feeds can be watermarked and include a wide arrange of overlays.

Setup is simple and instant with no complex setups or configurations.

We try to make this short and simple, for more information don't hesitate to contact us!
